

### Water Features

Waterwise Solutions is an established company specialising in the design, supply and installation of water features.

The range of water features available is only limited to the client's imagination. Formal lakes, informal pools, water cascades, floating fountains, rotating fountains, dancing fountains, complete displays with light and sound controlled by computer; the range is vast.

All features and sites are individual, which is why each design is a bespoke one. Waterwise Solutions will design, supply and install the water feature to suit you.

#### Floating Fountains

Floating fountains are ideal for existing bodies of water and within a day, a dramatic water feature can be yours.

These fountains are available with lights to create amazing effects at night and Waterwise Solutions can supply a special range to operate in shallow water.

As well as superb visual effects certain fountains can be used to aerate and mix the water thus helping to improve water quality.

We provide a full consultation on water quality improvement.

#### Jumping Jets

A popular water feature in parks and attractions, these provide a jet of water that jumps from one section to another

Waterwise Solutions supply and install Oase products. Made in Germany Oase equipment is, in our view, the best available. All products are of the highest quality and the range of pumps, nozzles and control systems is superb.

## Water Features

### Formal Fountains

The range of formal fountains is vast. Any effect can be designed from a simple jet to a multiple cascade of fountains with varying heights and colours.

The main components of a fountain are the pump, nozzle, the water basin (or tank etc) lights, delivery pipework and associated vales and fittings.

With formal fountains the control is also vital. We design unique control systems, from fountains operated on a simple timer basis to variable fountain heights which rise and fall depending on wind speed.

### Water Quality

Waterwise Solutions ensure that within the design of any system, the quality of the water will not be compromised. It is normal practice for a UV (Ultra Violet) light filter to be installed, together with a debris filter.

We also install dosing systems which inject special water treatment as required.

For larger bodies of water, aeration is critical and we can install both floating and fixed aeration systems, to help increase the level of oxygen within the water. This helps improve aerobic digestion which is nature's way of keeping water clean.

Waterwise Solutions can even help with advice on reed and gravel bed filters and other debris screens.

Details in this information sheet show only a very small part of the range of water features available.
